

### Testing Description

I've dealt with all sorts of testing related to developing the instructions and profile page. I have additionally created the location API where I checked the longitude and latitude of the user and entered it into the database. This took quite a bit of time and I eventually used the phone's location services instead of Google Maps API to locate the user's longitude and latitude. I had to take care of edge cases when dealing with the profile because at times the profile would not allow a "." to be entered into the email. Other things I had to handle was the conversion of the image that user has selected to a bitmap and storing that into the database as well. I had also created the 4 tests that this project has which each tests a different portion of the program. We separated the test cases by each having its own different functionality. We did not create a multitude of test cases where the same thing for different classes would be tested. Instead, each of our tests is unique.
