-If we put too long of an entry in seller submission text box, it will crash
       -Possible Fix: changing how it stores Strings or changing the XML text box
-Google Firebase Database will not accept "." as a submission into the database
       -Possible Fix: Email is turned into a key and keys cannot have "." in them.
            Just have another key be stored in place rather than using email as a key
-If we go back on MyProfile, and we press back, it will stay on the same page, but it will crash
       -Possible Fix: Not 100% sure on this, but it could be due to some form of memory leak
            as it is updating the list. We would need to find the statement causing
            the leak and seal it.
-Buy Page is known to occasionally crash for no reason
       -Possible Fix: Possibly a gradle error, changing gradle version may fix this
-Upon opening up the app again after closing it, the user has to log in again everytime as well
as the intro being repeatedly being shown
       -Possible Fix: Fix would be to have a variable that saves itself signifying that the app
            User has already opened the app once. This could also be used to keep the user
            Logged in as well
